

Sets - Part I

Set

- 1 Any well - defined collection of objects.
- 2 Set are usually denoted by capital letters.
- 3 Elements of set are usually represented by small letters.
- 4 If a is an element of set A , then it is represented as $a \in A$
- 5 If a is not an element of set A , then it is represented as $a \notin A$

Representation of Sets

- 1 **Roster Form** : Set is represented by listing its element in braces $\{ \}$ and they are separated by comma.
For e.g. $A = \{ a , e , i , o , u \}$, $B = \{ 1 , 2 , 3 , 4 \}$
- 2 **Set - Builder Form** : Set is represented by using statements depicting relation among its elements.
For e.g. $A = \{ x : x \text{ is a vowel in English alphabetic series} \}$
 $B = \{ x : x \text{ is a natural number less than } 5 \}$

Types of Sets

- 1 **Empty or null or void set** : It contains no elements
For e.g $A = \{ \}$
- 2 **Finite set** : It contains countable number of elements
For e.g $A = \{ 1 , 4 , 9 , 16 \}$
- 3 **Infinite set** : It contains uncountable number of elements
For e.g $A = \{ 1 , 4 , 9 , 16, \dots \}$
- 4 **Equal sets** : Two sets X and Y have same elements , represented as $X = Y$
- 5 **Unequal sets** : Two sets X and Y have atleast one uncommon elements , represented as $X \neq Y$
- 6 **Equivalent sets** : Two sets X and Y with same number of elements , irrespective of what elements are.
- 7 **Singleton set** : It contains only one element
For e.g. $A = \{ 0 \}$, $B = \{ i \}$
- 8 **Universal set** : Set of all elements in a particular context. For e.g. $A = \{ x : x \text{ is a real number} \}$

Subset and Superset

For two sets A and B , every element of A is also an element of B ,

- 1 A is subset of B , denoted by $A \subseteq B$
- 2 B is superset of A , denoted by $B \supseteq A$

Proper Subset and Proper Superset

Set A and B , A is a subset of B and $A \neq B$

- 1 A is proper subset of B , denoted by $A \subset B$
- 2 B is proper superset of A , denoted by $B \supset A$

Sets - Part II

Power Set

For a set A , power set is set of all subsets including empty set and A itself

For e.g. $A = \{ a , b , c \}$

Power set of $A = \{ \{ \} , \{ a \} , \{ b \} , \{ c \} , \{ a, b \} , \{ b, c \} , \{ a, c \} , \{ a, b, c \} \}$

For a set with m elements the power set has 2^m elements

Operations on Sets

For two sets A and B belong to universal set U

- 1 **Union of Sets** : It is collection of all the elements of A and B , represented as $A \cup B$
- 2 **Intersection of Sets** : It is collection of the elements common in both sets A and B , represented as $A \cap B$
- 3 **Difference of Sets** : It is collection of the elements of A which are not present in set B , represented as $A - B$
- 4 **Complement of Sets** : For set A , collection of elements which do not belong to A , represented as A^c

Properties of Operation on Sets

- 1 **Commutative law** : $A \cup B = B \cup A$,
 $A \cap B = B \cap A$
- 2 **Associative law** : $(A \cup B) \cup C = A \cup (B \cup C)$,
 $(A \cap B) \cap C = A \cap (B \cap C)$
- 3 **Idempotent law** : $A \cup A = A$, $A \cap A = A$
- 4 **Distributive law** : $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$
 $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$
- 5 **Law of Universal set** : $A \cup U = U$
 $A \cap U = A$
 $A \cup A^c = U$
 $A \cap A^c = \phi$

Venn Diagrams

It is a digrammatic representation of all possible relationships between different sets of finite number of elements.

For e.g. $A = \{ 2, 3, 5, 7 \}$, $B = \{ 2, 4, 6, 8, 10 \}$ can be represented using Venn Diagrams as
